## Overview

---

It is a configuration of two water reservoirs at different elevations that can generate power as water moves down from one to the other (discharge), passing through a turbine. The system also requires power as it pumps water back into the upper reservoir (recharge). A PSH system stores energy in the form of gravitational potential energy of water, pumped from a lower elevation. While the concept of pumped storage hydropower (PSH) is not new, adjustable-speed pumped storage hydropower (AS-PSH) is equipped with power electronics; thus, it has more capabilities and is more agile and flexible to integrate with modern power systems. It has gained a renewed interest.

Concluding remarks An extensive review of pumped hydroelectric energy storage (PHES) systems is conducted, focusing on the existing technologies, practices, operation and maintenance, pros and cons, environmental aspects, and economics of using PHES systems to store energy produced by wind and. Pumped storage plants are a combination of energy storage and power plant.

History

Pumped storage plants can operate with seawater, although there are additional challenges compared to using fresh water, such as saltwater corrosion and barnacle growth. Inaugurated in 1966, the 240 MW Rance tidal power station in France can partially work as a pumped-storage station. When high tides occur at off-peak hours, the turbines can be used to pump more seawater into the reservoir than the high tide would have naturally brought in. It is the only large-scale power plant of its kind.
