

PEES Power Systems

Cylinder wind-induced vibration power generation

Overview

This hydrokinetic power generating device can be simplified as a spring supported cylinder with upward-downward motion, induced by vortex shedding, and an energy harvesting system, which can generate power from currents as slow as 0. The bladeless wind turbine (BWT) using vortex-induced vibration is a new class of wind turbine that does not have traditional rotating blades and converts wind energy into vibration energy and into electrical energy based on vortex-shedding principles. The setup consists of a cylinder mounted on four springs and is subjected to a uniform and steady flow of.

Abstract- To fulfil the ever increasing energy demand, thus increased fossil fuels consumption globally has been posing the serious concern of global warming and climate change. This has shifted focus of research on renewable, eco-friendly green sources of energies. In this paper, the hydrodynamics of a wind-wave combined power generation system was simulated in Fluent. It harnesses wind energy from a phenomenon of vorticity called Vortex Shedding. Basically, bladeless technology consists of a cylinder fixed vertically with an elastic rod.

Cylinder wind-induced vibration power generation

A Novel Small-Scale Bladeless Wind Turbine Using Vortex-Induced

This study proposes a novel bladeless wind turbine that can shift the structural resonance to operate at a wider range of wind speeds to improve the effective power generation region.

VIVWPGEN (Vortex Induced Vibration Wind Power Generation): ...

The energy harvesting from vibration induced by flowing fluid is a promising new technology under research which can overcome these problems.

Numerical Study on a Cylinder Vibrator in the Hydrodynamics of a ...

In this paper, the hydrodynamics of a wind-wave combined power generation system was simulated in Fluent. The fluid-structure coupling simulation of the vortex vibration of the

Advanced Aerodynamic Energy Harvester Based on the ...

DVNG is designed based on advanced aerodynamic principles, significantly enhancing aerodynamic performance through dual-cylinder vortex-induced vibration coupling and integrating ...

LPSB48V400H
48V or 51.2V

Wind tunnel experiments on flow-induced vibration and energy ...

This study presented a comprehensive experimental investigation of flow-induced vibrations and energy harvesting in two tandem-cylinder configurations, revealing that the position of the vibrating cylinder ...

Vortex-induced vibration wind energy harvesting by

The harvester comprises of a cylindrical oscillator attached to a piezoelectric MEMS device. Wind tunnel experiments are conducted to measure the power output of the energy harvester.

Assessing voltage and power prediction in vibrating cylinders using

Development of a novel wind tunnel experimental framework to investigate flow-induced vibration in tandem circular cylinder configurations, enabling systematic evaluation of geometric ...

Micro-electricity generation from wind-induced vibration with

This study aimed to experimentally investigate flow-induced vibration of modified circular cylinders for wind-receiving mast of Vibration-Based Power Generator (VBPG).

LPW48V100H
48.0V or 51.2V

Low-speed wind energy harvesting from a vibrating cylinder and an

An experimental setup has been developed to analyse the impact of cylinder transverse vibration caused by flow-induced vibration, and to improve wind energy harvesting from these ...

Vortex Vibration Resonant Wind Generator

Basically, bladeless technology consists of a cylinder fixed vertically with an elastic rod. The cylinder oscillates on a wind range, which then generates electricity through an alternator system. In other ...
