Do thin-film solar panels generate electricity

Overview

Thin-film solar cells are a type of photovoltaic device that converts sunlight into electricity using layers of semiconductor materials applied thinly over a flexible substrate. You'll see the black-paned rectangles on the rooftops of houses or assembled into arrays across fields and prairies. But the panel as we have come to know it -- 5. Student at West High School, Iowa City, Iowa. Encyclopaedia Britannica's editors oversee subject areas in which they have extensive knowledge, whether from years of. Each thin-film solar panel is made of 3 main parts: Photovoltaic Material: This is the main semiconducting material and it's the one responsible for converting sunlight into energy such as CdTe, a-Si, or CGIS. It doesn't matter what type of thin-film solar cell you are making as they are all made.
