Liquid flow battery circulation device

Overview

A flow battery, or redox flow battery (after reduction–oxidation), is a type of electrochemical cell where chemical energy is provided by two chemical components dissolved in liquids that are pumped through the system on separate sides of a membrane. Their unique design, which separates energy storage from power generation, provides flexibility and durability. The liquid contained in the flow battery contains active ions that will flow through the electrochemical cell. During discharge, chemical reactions release electrons on one side.
