New air energy storage

Overview

Liquid air energy storage could be the lowest-cost solution for ensuring a reliable power supply on a future grid dominated by carbon-free yet intermittent energy sources, according to a new model from MIT researchers. MIT PhD candidate Shaylin Cetegen (pictured) and her colleagues, Professor Emeritus Truls Gundersen. Compressed Air Energy Storage (CAES) has emerged as one of the most promising large-scale energy storage technologies for balancing electricity supply and demand in modern power grids. Renewable energy sources such as wind and solar power, despite their many benefits, are inherently intermittent. Compressed air energy storage (CAES) is a promising solution for large-scale, long-duration energy storage. Researchers from MIT and Norwegian University of Science and Technology (NTNU) find that liquid air energy storage (LAES) represents a promising solution for long-duration storage in grid environments on a decarbonised power network. The power grid depends on reliable and economical energy storage.
