Principle of solar power generation control system

Overview

The DC control system is used to adjust, protect, and control the entire transmission and exchange process of electrical energy from the photovoltaic array to the storage unit and then to the inverter unit, to maintain the high efficiency and safe operation of the system. This energy can be used to generate electricity or be stored in batteries or thermal storage. Below, you can find resources and information on the. Solar power generation control devices—often called charge controllers—play a critical role in maximizing energy efficiency and protecting system components.
