# Reliability of large-scale energy storage systems

## Overview

---

This paper provides a comprehensive review of these challenges, with a focus on the critical role of energy storage systems (ESSs) in overcoming them by evaluating their technical, economic, and environmental performance. The International Renewable Energy Agency predicts that with current national policies, targets and energy plans, global renewable energy shares are expected to reach 36% and 3400 GWh of stationary energy storage by 2050. However, IRENA Energy Transformation Scenario forecasts that these targets. However, the increasing integration of large-scale intermittent RESs, such as solar photovoltaics (PVs) and wind power systems, introduces significant technical challenges related to power supply stability, reliability, and quality. Unlike residential or commercial-scale storage, utility-scale systems operate at multi-megawatt (MW) and multi-megawatt-hour (MWh) levels, delivering grid-level flexibility, reliability, and. Large-scale lithium-ion battery storage is expanding rapidly, often with limited public discussion of safety and environmental risks.
