Solar Photovoltaic Power Generation Module

Overview

Photovoltaic modules, or solar modules, are devices that gather energy from the sun and convert it into electrical power through the use of semiconductor-based cells. Some PV cells can convert artificial light into electricity. Sunlight is composed of photons, or particles of solar energy. These photons contain varying amounts of. In early 2025, Trina Solar set a new world record for solar conversion efficiency in n-type fully passivated heterojunction (HJT) solar modules, reaching 25. This breakthrough highlights how the latest solar panel technology continues to push performance boundaries, helping reduce system size. Solar energy can be harnessed two primary ways: photovoltaics (PVs) are semiconductors that generate electricity directly from sunlight, while solar thermal technologies use sunlight to heat water for domestic uses, to warm buildings, or heat fluids to drive electricity-generating turbines.
