Solar drying system

CE UN38.3 

Overview

In indirect solar dryers, the black surface heats incoming air rather than directly heating the substance to be dried. This heated air is then passed over the substance to be dried and exits upwards often through a, taking released from the substance with it. They can be very simple, just a tilted cold frame with black cloth to an insulated brick building with active and a back-up heating system. One of the advantages of the indirect system is that it is easier to protect the food, or other substance.
