# Solar power generation ecological restoration

## Overview

---

Solar farms, often built on degraded land, help restore ecosystems by reducing the need for destructive farming or industrial activities. Abandoned agricultural land or former mining sites can be repurposed for solar energy, and the surrounding areas can be rehabilitated to foster. Scientific and reasonable vegetation restoration plays a pivotal role in enhancing soil quality, boosting ecosystem services, and ensuring the long-term stable operation of photovoltaic (PV) power stations in desert regions. To elucidate the response mechanisms of soil under different vegetation. CPVG (Utility-scale photovoltaic generation) is expanding rapidly worldwide, yet its cumulative ecological effects remain insufficiently quantified. This research presents a comprehensive review of the ecological. □ Promote the development model of PV industry + ecological restoration for mutual benefit and multiple-win.
