Solar power generation without load

Overview

Battery-less solar panel systems, also known as direct solar power systems, operate without the need for energy storage solutions like batteries. These systems are designed to provide power directly from solar panels to appliances and other loads when the sun is shining. are “grid-tied” systems without batteries (although solar. While it is not common, it is possible to use a solar panel directly without a battery or the grid as a reference, but you need to use an electronic called DC to DC converter, which stabilizes the voltage at a certain level. When photons hit the semiconductor junction, electrons move and create DC power—this is the raw output of your array. See the high-level background in the IEA's Solar Energy Perspectives.
