Overview

The production methods for solar thin film technology differ markedly from those of traditional silicon cells. Vacuum deposition, sputtering, and chemical vapor deposition are among the prevalent techniques employed. Thin-film solar cells are a type of solar cell made by depositing one or more thin layers (thin films or TFs) of photovoltaic material onto a substrate, such as glass, plastic or metal. Student at West High School, Iowa City, Iowa. These materials, often cadmium telluride or amorphous silicon, offer flexibility and lower production costs, 3. This literature review examines the key materials and advancements that make up TFSC technologies, with a focus on Cu. This chapter aims to provide a comprehensive overview of thin films in solar technology, covering their historical development, types, fabrication techniques, performance characteristics, applications, market trends, and future prospects.
