The difference between off-grid and on-solar container grid inverters

Overview

On-grid inverters are connected to the electrical grid and do not offer power backup, shutting down during a grid outage. When choosing the right inverter for a solar energy system, it's essential to understand the fundamental differences between on-grid (grid-tied) and off-grid inverters. When building a solar power system, choosing the right type of inverter is one of the most important decisions. Inverters are responsible for converting DC electricity from solar panels into AC electricity. Whether you're powering a city home or a remote cabin, the type of inverter you choose—on-grid or off-grid—determines how you generate, use, and store solar power. These systems rely on batteries to store the energy produced by solar panels.
