# The harm of low air temperature of hydrogen-cooled generator

## Overview

---

A drop in hydrogen purity causes windage losses, higher power generation cost per megawatt, and reduced generator efficiency. The density of hydrogen is only 7% of the density of normal air, which reduces torque losses due to windage. The atomic weight of hydrogen is about 1. My goal is to present information that will be useful in running your plant in the most profitable way for the long term. 168 W/ (m·K) of all gases; it is 7 to 10 times better at cooling than air.

## Online Gas Analysis of Hydrogen-Cooled Electric Power ...

Hydrogen is readily available and has a thermal conductivity that is higher than air, making it a very good cooling medium. Hydrogen has also a much lower viscosity than air. This significantly decreases the ...

## Hydrogen-cooled turbo generator

The absence of oxygen in the atmosphere within significantly reduces damage to the winding insulation from corona discharges; these can be problematic as the generators typically operate at high voltage, often 20 kV. The bearings have to be leak-tight. A hermetic seal, usually a liquid seal, is employed; a turbine oil at pressure higher than the hydrogen inside is typically used. A metal, e.g. brass, ring is pressed by springs onto ...
