# Using New Zealand data center racks with constant temperature and humidity in remote areas

## Overview

---

This blog explores the best practices for implementing remote temperature and humidity monitoring in data centers, providing valuable insights for data center operators and managers. Most data centers have four types of environmental areas: ballroom spaces, hot aisles, cold aisles, and grey areas. Many data center designs have computer rooms where cold air is distributed through a raised floor system. On this page you will find the standards recommended by ASHRAE for monitoring the environment in your data center or server room. The settings below apply to A1-A4 class data centers and server rooms. Inside mission-critical environments, even small humidity fluctuations can lead to costly downtime or damage to sensitive electronic equipment. At low humidity, static electricity can build. If you're worried about your PC or data center operating at the right temperature, you're on the right track: The combination of ambient temperature and relative humidity (RH) directly affects reliability hardware performance and lifespan. However, you can't create individual climates for each piece of gear, because it all.

## Recommended standards for monitoring server rooms and data centers

When using hot corridors it is important to monitor temperature across the room to ensure that sufficient cold air gets to each rack. In this case however one can also rely on rack based temperature sensors ...

## General guidelines for data centers

There are several ways to perform this assessment, but the most common is to review the heat load and cooling in logical sections defined by I-beams, airflow blockages, or CRAC unit locations.
