What is the wind resistance of a wind turbine

Overview

Wind resistance is a nonconservative force because it dissipates the kinetic energy of the moving object, converting it into thermal energy that is lost to the environment. Suppose that the wind blows with a speed of (V) . Now, let's put an "imaginary tube" with cross section of (A) parallel to the wind's velocity direction. Let (Δt) be an arbitrarily chosen time period. This paper reviews the current research progress and methods on wind resistance, seismic resistance and vibration control of. Although the American Wind Energy Association estimates that only about 2 percent of U. Department of Energy has said that wind power could account for a fifth of the nation's electricity supply by 2030.
