Where is the wind inlet to the generator set

Overview

To prevent the return of hot air, the inlet of the diesel generator set should be as far away from the exhaust outlet as possible, and the air in the machine room should be allowed to flow directly. The inlet should be protected to prevent rainwater and other foreign objects from. Ventilation is typically done through the use of an air inlet, air outlet/exhaust fan, and/or other ventilation openings. The air inlet must be capable. D. Position the generator set so that the prevailing wind do not enter into the radiator / exhaust outlet. If this is not possible, install a wind barrier. The cooling system on an ICE electrical generator typically comprises a water-circuit radiator to cool the engine block and may also include radiators for oil cooling as well as charge air circuit cooling for the engine intake air. Open packages are usually installed inside a buildin or beneath a canopied structure to protect them from the elements.
