# Which angle is the photovoltaic panel tilted

## Overview

---

An easy method for determining solar panel tilt is to match the latitude of your home. This can vary depending on your north-south location, but it generally ranges from 30-45 degrees for homeowners in the continental United States. The solar panel's best angle determines how much sunlight your panels capture throughout the year, directly impacting energy production and ROI. A correctly tilted system can improve efficiency by 5-10% annually, reducing payback time and boosting long-term savings. Being 5-10 degrees "flatter" than perfect is often better for self-cleaning (rain washing) than being too steep. Don't worry if your roof isn't perfect. It's a crucial factor in the design and performance of a solar energy system, as it directly affects the amount of sunlight that strikes the panel's surface and, consequently, the amount of electricity generated.
